

Water Kit Setup

- Kit Includes- Peck cups, 5/16" tubing, hose clamps, 5/16" bulkhead, Zip ties, T-joint (2+ kits)
- Drill a 5/16" hole on the bottom side of a bucket and feed the bulkhead in from the inside. Threads sticking out.

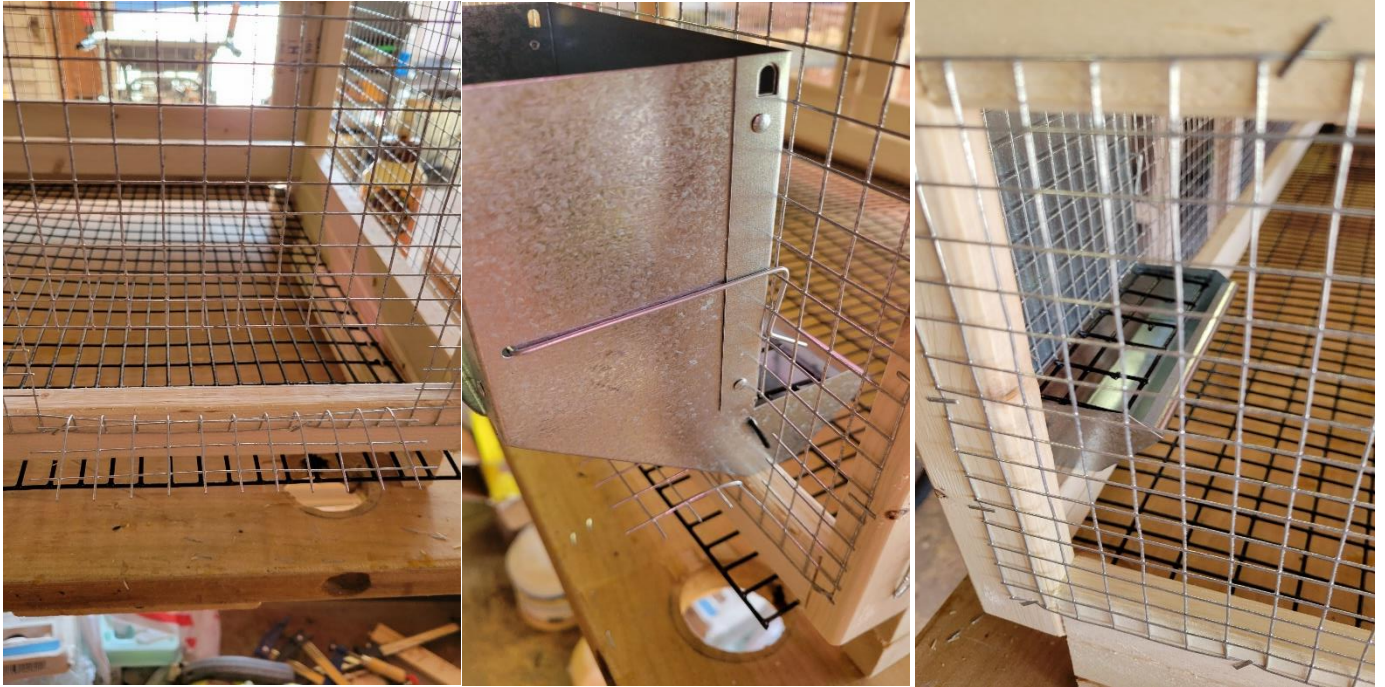

- Attach the tubing to the bulkhead with supplied clamp. Its best to work from top down to ensure there is the correct length of tubing to fit the setup. For single kits, the tubing will run down to the peck cup and attach directly. If there is more than a single cup, use the supplied T-joint between the bucket and peck cup. Attach peck cups with supplied zip-ties wherever you decide.

Feeder

- Feeders will come with our own style of no-waste grate installed. These can be placed wherever you decide but we do recommend on the back with the bottom sitting on the wood.
- Cut a hole that is 4 squares (2") up and 12 squares (6") across. The feeder will slide in and the side latches will hook onto the wire.

Please don't hesitate to reach out if you have any questions or issues setting up. We are always happy to receive any feedback. Thank you for your support!

Happy Hatching!
